

Homework 7 – Links, Pseudo-Elements, Mobile Design, and Accessibility

Name: Can Atalay

Department: Computer Engineering

University: Near East University

1. How would you link to the named fragment #jobs on the page employ.html from the home page of the site?

Answer:

```
<a href="employ.html#jobs">Jobs</a>
```

Explanation:

To link to a named fragment on another page, the file name is written first, followed by the fragment identifier. In this case, employ.html is the page and #jobs is the target section on that page.

2. Which pseudo-element can be used to generate content that precedes an element?

Answer:

:before

Explanation:

The :before pseudo-element is used to insert generated content before the content of an element. In modern CSS, it is commonly written as ::before.

3. Which of the following is a mobile web design best practice?

Answer:

Configure a single-column page layout.

Explanation:

A single-column layout is easier to read and navigate on mobile devices because mobile screens are smaller than desktop screens. It also reduces horizontal scrolling and improves usability.

4. Find the Error

Question:

The page is intended for the navigation area to display on the right side of the browser window. What needs to be changed to make this happen?

Answer:

The error is in the CSS rule for the nav element. The navigation area is currently floated to the left:

```
nav {  
    float: left;  
    width: 120px;  
}
```

To display the navigation area on the right side of the browser window, float: left; should be changed to float: right;.

Correct Code:

```
nav {
```

```
float: right;  
width: 120px;  
}
```

Explanation:

The float property controls where an element is positioned horizontally. Since the navigation area should appear on the right side, the correct value is float: right.

5. Web Research – Web Content Accessibility and Mobile Web

Summary:

Web accessibility and mobile web design have many important areas of overlap. Accessibility focuses on making websites usable for people with disabilities, while mobile web design focuses on making websites usable on smaller screens and mobile devices. However, many techniques that improve accessibility also improve the mobile user experience.

One major area of overlap is clear structure. Web developers should use proper headings, lists, and semantic HTML elements so that content is easy to understand and navigate. This helps users with screen readers, and it also helps mobile users scan content quickly on smaller screens.

Another important overlap is text readability. Websites should use readable font sizes, strong color contrast, and flexible layouts. Good contrast helps users with visual impairments, but it also helps mobile users who may be using a phone outdoors in bright sunlight. Flexible layouts help content adapt to different screen sizes without requiring horizontal scrolling.

Alternative text for images is also important. Users who cannot see images need alt text to understand the purpose of the image. Mobile users can also benefit when images do not load properly because of slow connections. In both cases, alternative text keeps the content understandable.

Navigation is another shared concern. Websites should have simple menus, clear links, and touch-friendly controls. This supports users with motor disabilities and also helps mobile users who interact with websites using touchscreens. Buttons and links should be large enough to tap easily.

Web developers can support both accessibility and mobile devices by following responsive design principles, using semantic HTML, providing text alternatives, maintaining good color contrast, avoiding fixed-width layouts, and testing websites on different devices. According to W3C, mobile accessibility is covered by existing W3C accessibility standards such as WCAG, and WCAG applies to web content across devices including mobile devices. Therefore, designing for accessibility and designing for mobile users should not be treated as separate goals. A well-designed website should be usable by everyone, regardless of device or ability.
